Speed up your PC:

Every key stroke we make on our pc's is copied by Windows O.S. in a hidden cache as a start-up item. Over time this slows down your PC.

Internet Security Software , such as Ccleaner ,Malware byte does **NOT** reach these Windows generated Cache's.

I use regularly Two Microsoft tricks received from my PC Doctor.

1. Delete Windows cache:

Go to your search bar and type:

" %temp% " click enter.

A new Window appears showing a lot of (useless) files & folders.

Highlight the first item – then press and hold "shift" and browse down to the last item–press enter. Now all items are highlighted – make a right click somewhere on this highlighted Window and then select "delete" and click enter.

Now they are deleted but have moved to your Recycle Bin.

You need to empty the Bin.

2. Delete Windows "DNS".

Another hidden Windows Cache with copied hidden duplicate file "DNS" which stands for "DO-NOT-SHOW".

Go to your search bar and type: "CMD" press enter.

A new registry window opens. You see a ticker blinking. Type direct next to it: "**ipconfig/displaydns**"

Click enter. You will see a lot of flushing DNS.

At the end of the display run you see the live ticker again.

Type direct next to it:

"**ipconfig/flushdns**"

Press enter.

Not much happened on the display now but you see a new line which reads:

You have successfully flushed DNS

Close this Window.

Your PC will now boot up and perform much faster!!

Do this Trick once monthly.

PS: There are off course Microsoft pay – version apps available that speed up your slow PC.

Microsoft – greedy for extra revenue - does not tell you anything about the reason why your PC is slow. The fact that Microsoft is the culprit is carefully hidden!!
